

Internship Program Structure

NTHRYS offers hands-on internships for students and graduates. Gain practical skills and industry insights across various fields. Apply now for valuable learning and career opportunities.

At NTHRYS, we don't offer stipends for internships because 99.99% of students lack basic practical or research skills. Our staff spends a lot of time training them, and our focus is on quality learning rather than just doing routine work.

Many interns who come to us have previously worked at big companies that offered stipends. However, they were treated more like laborers than learners. Instead of gaining valuable research experience, they were stuck doing repetitive tasks like simple DNA extractions or preparing PCR mixes, without really learning the core of research or product development.

At NTHRYS, we provide a different experience. Interns get hands-on training in product formulation research, research methodology, protocol design, literature surveys, and more. They practice essential lab techniques until they are confident in them. Our aim is to make sure interns truly learn and grow.

Don't get caught up in just earning a stipend in production companies—think about the bigger picture. If you want to start your research career the right way, focus on gaining real skills and experience that will set you apart.
